TABLE OF CONTENTS

INTRODUCTION

Not long after birth, children of the soon-to-be 21st century begin developing an affinity for screens. Before their first day of kindergarten, children are entertained and taught by television, computers, and movies. For these kids, technology is a natural medium for interaction. It makes sense for teachers and schools to try to tap into technology as much as they can to meet instructional objectives. In junior high and high school math classes, hand-held graphing calculators about the size of a Game Boy have become a comparatively inexpensive way to access mathematics software. The programming capabilities of these calculators are an especially powerful resource for educators. By using and creating graphing calculator programs with their students, teachers help students focus on understanding algorithms and logical processes. Once students have a knowledge of BASIC programming, they can begin to create useful and sometimes very sophisticated programs.

While Texas Instruments is not the only company marketing graphing calculators, it is the creator of the graphing calculators now most prevalent in schools, the TI-81 and TI-82. For the TI-82, two-person games like Connect4 and Battleship, as well as programs and lesson plans that teachers have used to teach math concepts, can all be accessed on the Internet. Texas Instruments has also published numerous other books of instructional materials for use with the calculators, and magazines such as Mathematics Teacher include graphing calculator activities for the TI-82 in almost every issue.

For students buying a graphing calculator, and for teachers making decisions about which calculators to purchase as classroom sets, the question arises, "Is the TI-82 calculator the only reasonable choice or might another calculator have additional desirable features that would help explain and illustrate mathematics concepts?" For example, the latest Casio graphing calculator,

the CX-9850G, is equipped to graph functions in three different colors. Its "Home" screen is an icon menu, which includes many of the same options as the TI-82, as well as some that are new and unique. In Dynamic Graphing mode, a function can be entered with a variable in place of a coefficient or a constant, and a range for the variable can be specified. After pressing enter, the calculator displays the graph of the function for each value of the variable, showing the effect of that variable on the graph in a dynamic way. The CFX-9850G can also perform operations with complex numbers and has memory space for 36 lists as well as a special function memory, for those functions most often used. While it is not the purpose of this paper to make judgments about which calculator is better, it would be in the best interests of all if a way could be found to translate those programs which have been found to be most useful from one graphing calculator language to another. This manual, comparing the programming commands of the TI-82 and the Casio CFX-9850G, is a first step in that direction.

The manual is written using the TI-82 menus as a starting place. However, the comparison is meant to work both ways. If no exact match for a TI-82 command exists on the Casio, a workable substitute is offered whenever possible, and vice versa. If no substitute commands were found, the statement "Not available" appears in the chart. The first two columns of the charts compare the commands descriptively, with italicized words written in for the parameters. The symbolic Casio commands are replicated exactly, with one exception: ◁ is used to indicate the Display command. The third and fourth columns offer examples of the way each command might appear within a program, using values and variables for the parameters. The fifth column tells the user, in step-by-step fashion, where to locate each command on the Casio. The menu items above the function keys are given in sequence, with > representing the F6 (next menu) command. Part II of the manual lists several menus which are entirely unique to the CFX-9850G.

The author hopes this manual will be useful in several ways to teachers and students. For those who are familiar with the TI-82 and would like to learn about the CFX-9850G, the manual could serve as a miniature course in "Casio". For students with Casios in classrooms where the TI-82 is used on a regular basis, the manual could serve as a "quiet" translator, saving the teacher from giving calculator instructions in two languages. And, for all those interested in becoming bilingual or multilingual calculator users, this manual will no doubt be a springboard for further discoveries of computer kinship!

CASIO Color Menu

Command	Description	Location
P/L-Blue **P/L-Orange** **P/L-Green**	Sets default color for graphs.	SET UP > P/L F1~F3
Blue **Orange** **Green**	Sets color for stat graphs.	F4 STAT COLR F1~F3
BlueG # **OrangeG** # **GreenG** #	Sets color for graphs of functions and recursions.	F4 GRPH COLR F1~F3 [See Prgm Mode Command List for more locations]

CASIO List and Function Memories

Command	Description	Location
ListFile: **File1 ~ File6**	Specifying a File within a program activates the 6 lists stored under it. A total of 36 lists can be stored by the CFX-9850G.	SET UP >, > LIST F1~F6
Function Memory: **f1 ~ f6**	Within a program, RCL (F2) fn (F1~F6) causes the function chosen to be copied to the current program line. Likewise, STO (F1) fn causes the current program line to be stored to the function chosen. While a function may not be stored to function memory using the → command, f1~f6 may be evaluated and sketched.	OPTN >, > F-MEM F1~F3

CASIO Equation Menu

Command	Description	Location
Sim Result	Displays the result of solving the current system of equations (entered in EQN mode) simultaneously.	VARS > EQUA F1
Sim Coeff	Displays a matrix of the coefficients of the current system of equations.	F2
Ply Result	Displays the result of solving the current polynomial (entered in EQN mode) for its roots.	F3
Ply Coeff	Displays a matrix of the coefficients of the current polynomial.	F4
